# Introducing Crest Infosolutions

- ✓ Founded in 2012 in Singapore
- ✓ Serving customers globally with presence in Singapore, Malaysia, Indonesia, USA and Netherlands
- ✓ **MariaDB distributor** and partner since 2015.
- ✓ Strong MariaDB consulting team with experience in setting-up and securing MariaDB at scale.
- ✓ **Migration team to support** customers in their database migration journey from Oracle, MS SQL, MySQL or PostgreSQL to MariaDB.

**Crest Infosolutions LLC Joins MariaDB Foundation as Silver Sponsor**  
Written by Anna Widemus · 2025-09-24 · Leave a comment

**SILVER SPONSOR**

**CREST**  
— Ideas — Inevitable — Implemented —

**MariaDB Foundation**

**Accelerating Digital Transformation Through Open Source Innovation**

The MariaDB Foundation is pleased to welcome Crest Infosolutions LLC as a Silver Sponsor, marking a significant step forward in fostering enterprise-grade open source adoption. This partnership reinforces Crest's mission to deliver robust, secure, and scalable technologies that empower global organizations to thrive in the era of digital transformation.

**Driving Open Source Adoption Across Enterprises**

Crest Infosolutions brings over a decade of experience in delivering open source excellence to its clients. Crest is already a long-standing partner of MariaDB plc and, by joining the MariaDB Foundation ecosystem of supporters, Crest reinforces its longstanding commitment to open technologies, developer collaboration, and sustainable innovation.

"We are excited to welcome Crest Infosolutions to the MariaDB Foundation sponsor family," said Anna Widemus, CEO of the MariaDB Foundation. "As experts in enterprise content management, EPM, and AI-driven solutions, Crest represents exactly the kind of real-world use case MariaDB Server's vector search capabilities was built for. Their support reflects a shared belief in open source innovation with integrity—where advanced technology like vector search becomes truly enterprise-ready."

**A Powerful Technology Stack Built on MariaDB**

As part of its open source enterprise portfolio, Crest integrates **MariaDB** as the backbone of high-performance applications. Their stack includes:

# CREST PRESENCE

# Avoid Vendor lock-in for Oracle Dependent Apps with MariaDB Enterprise

Pandikrishnan  
MariaDB Corporation

# Celebrating 15+ Years of MariaDB !!

The first version of MariaDB, 5.1.38, was released on **29th of October 2009 !**

**We have come a long way since then!**

**Creator of MySQL and MariaDB - Michael Widenius(Monty)**

**More information at**

**<https://monty-says.blogspot.com/2024/10/celebrating-15-years-of-mariadb.html>**

# About MariaDB

Created by the original developers of MySQL, MariaDB provides a powerful, open-source core database for enterprises. Now the default in the majority of Linux distributions, it gives businesses the strategic freedom to break from proprietary databases and build modern, scalable applications for the future.

## Market Leadership

**75%**

Of Fortune 500 companies use MariaDB

**1B+**

Docker Hub downloads

**2.5B+**

Reach via Linux distros

**200K+**

Open source contributions

## 700+ Customers Globally

Amdocs  
Deutsche Bank  
Development Bank of Singapore(DBS Bank)  
Nokia  
Samsung  
SelectQuote  
ServiceNow  
Virgin Media O2

## 200+ Employees

Proven leadership team

World class relational database engineering team, including the original core MySQL team

Dual headquartered

- Europe: Dublin, Ireland
- USA: Silicon Valley, California

**Oracle is one of the most difficult vendors to manage, leaving you feeling confused and vulnerable**

**They have over 400 employees whose primary role is conducting audits**

# Why Move Away from Oracle?

Working with them can be frustrating and cost prohibitive

## Licensing Concerns

Requires two licenses per core if using other cloud provider

Virtual machines require a license per core, regardless of how many cores are being used for Oracle

## Favors use of Oracle products

Exadata recommended for on premises

Oracle Cloud recommended for cloud based

Virtual machine usage can be costly

## Annual increase in support fees

Even as support usage is likely to lessen

Currently, 8% additional per year

## Difficult to scale back

Reducing number of licenses may not result in significant decrease in costs

# Why Move Away from Oracle?

Licensing concerns lead to frustrations

## Compliance Issues

Minor corporate activities may lead to audits

Audits usually uncover some form of license violation

## Complex Licensing

Confusion around licensing may lead to unintentional violations of agreement

Audit reimbursements can be significant, as much as \$50M

Alternate cloud providers double the license fee

## Per Core Licensing

On a virtual machine, all cores must be licensed, regardless of their intended use

This results in higher usage costs and possible license violations

# Power That Outperforms Price

One Year Total Cost of Ownership

## MariaDB Benefits

Significantly lower subscription cost

Low effort migration

Over 80% TCO reduction

Use your own hardware, cloud, or a combination of the two

Based on MariaDB [migration savings calculator](#)

10 applications

50% critical applications, 50% non critical applications

3 nodes per critical application, 1 node per non critical application

4 cores per database

# MariaDB Enterprise Platform versus Oracle Enterprise Edition

## Benefits Comparison

| <b>MariaDB Enterprise Platform</b>  | <b>Oracle Enterprise Edition</b>   |
|---|--|
| Up to 90% lower cost  | Costly license and support fees that grow each renewal cycle                 |
| Runs on low cost hardware, in the cloud, or hybrid                        | Encourages use of expensive proprietary hardware                             |
| Developers benefit from a modern data model, enabling greater flexibility | Limits developer innovation due to difficulty with management and deployment |
| Database consolidation enables a single database to meet multiple needs   | Standalone environment for maintenance and use                               |
| Clustering, encryption, and advanced compression included in core product | Available at extra cost  |

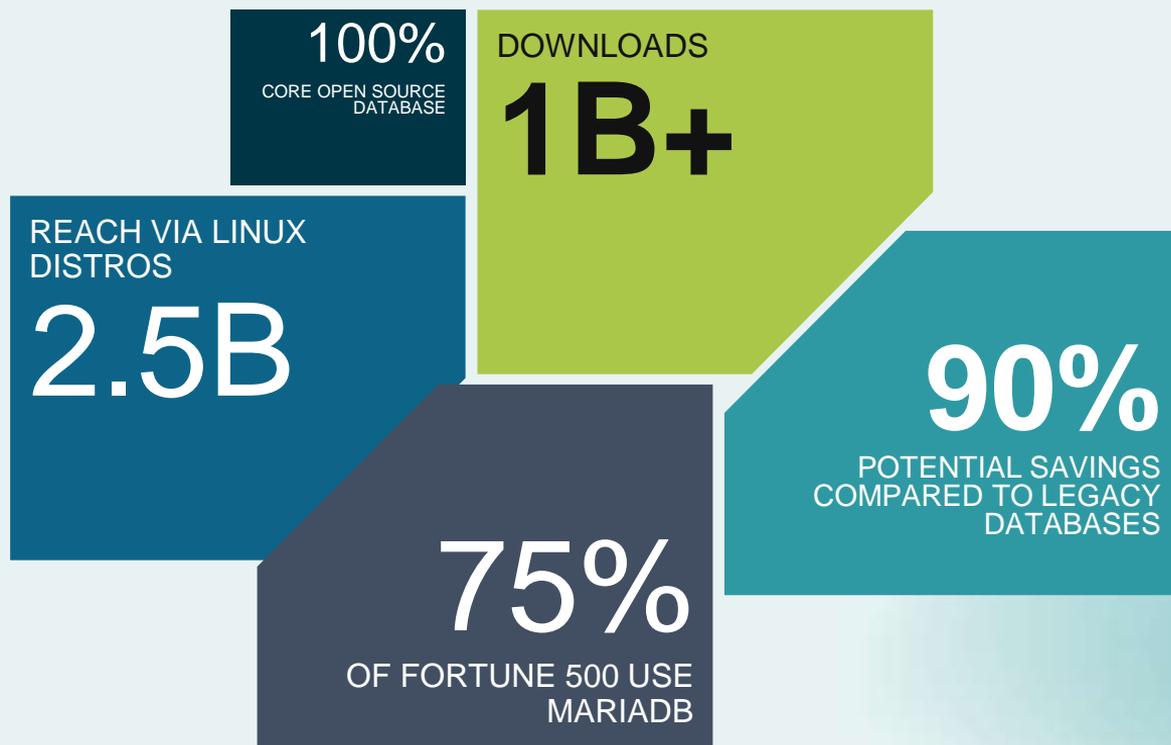

|  | MariaDB Enterprise Platform | Oracle Enterprise Edition | Microsoft SQL Server Enterprise | IBM DB2         |
|--|-----------------------------|---------------------------|---------------------------------|-----------------|
| <b>Replication</b>   | Yes                         | GoldenGate, Data Guard*   | Availability groups             | SQL replication |
| <b>Clustering</b>  | Multiple clustering options | RAC*                      | Yes*                            | Yes             |
| <b>Multicloud Single-architectures</b>                     | Yes                         | No                        | No                              | No              |
| <b>Backup and restore</b>                                  | MariaDB Enterprise Backup   | RMAN                      | Yes                             | Yes             |
| <b>Built-in SQL IDE</b>                                    | Yes                         | Yes                       | Yes                             | No              |
| <b>Distributed partitions with legacy RDBMS connectors</b> | Multiple options            | Oracle Partitioning*      | No                              | DPF             |
| <b>Compression</b>   | Multiple options            | Yes                       | Yes                             | Yes             |
| <b>Encryption</b>  | Yes                         | Yes                       | Yes                             | Yes             |
| <b>Columnar</b>  | MariaDB ColumnStore engine  | In-Memory ColumnStore     | Yes                             | CDE             |
| <b>Temporal</b>  | Yes                         | Yes                       | Temporal Tables                 | Yes             |
| <b>Stored procedures</b>                                   | SQL, PSM, PL-SQL, C         | PL, SQL, Java             | T-SQL                           | Db2-SQL, SQL PL |
| <b>Oracle compatibility</b>                                | Yes                         | Yes                       | No                              | Yes             |

\*Not included in Oracle Database Enterprise Edition license; must be purchased separately.

# Why MariaDB Enterprise Platform 2025

# MariaDB Is Everywhere

The enterprise open-source database, engineered by the pioneers of relational databases to power any workload—from transactional to analytical—with proven reliability.

# Companies Around the Globe Rely on MariaDB

# The Complete Enterprise-Grade Platform

Delivering Performance, Scalability, Availability, and Security

## MariaDB Tools

Workload Capture & Replay

Safe Upgrade Testing

Workload Visualization

Administrative User Interface

Enterprise Backup

MariaDB Monitoring

Flashback

Instant Schema Change

## MariaDB Application Connectors

C

JDBC

ODBC

Node.js

Python

C++

R2DBC

PowerBI

Kafka

Spark

## MariaDB MaxScale

High Availability

SQL Aware Read Scaling

Failover Orchestration

Replica Rebuild

## MariaDB Enterprise Server Core

Enterprise Replication

Enterprise Cluster

Enterprise Audit

Enterprise Security

### Workloads

Transactional (OLTP)

Analytical (OLAP)

Semi-structured

AI and ML

Cloud-native (public, private, and hybrid clouds)

## MariaDB Integration

Kubernetes Operator

Docker Containers

Caching: In-Memory, Redis, Memcached

NoSQL Protocol

Kafka CDC Router

Oracle Mode

# MariaDB Enterprise Platform Key Capabilities

MariaDB Enterprise Platform delivers multiple benefits when migrating from Oracle

**SQL\_MODE = ORACLE**  
enables compatibility with Oracle Database SQL syntax and behavior

- Migrate applications while preserving the behavior and syntax of Oracle SQL
- Ensures existing SQL scripts, application logic, and database interactions are compatible

**Multi-master setup** option through Galera provides replication and scalability

**MariaDB MaxScale** is a robust and advanced intelligent database proxy

**Multiple storage engine** choices deliver OLTP and OLAP from a single source

Fast and scalable **vector search** using the HNSW algorithm

# ORACLE Mode in MariaDB Enterprise Platform

Set `SQL_MODE = ORACLE` to enable compatibility with Oracle Database SQL syntax and behavior

Migrate applications from Oracle Database to MariaDB while **preserving the behavior and syntax of Oracle SQL**

Ensures **existing SQL scripts, application logic, and database interactions are compatible** with MariaDB behavior

Oracle mode updates items to ensure compatibility

- Stored procedures
- Cursors
- Variables
- BEGIN blocks
- Functions
- SQL types
- Null handling
- Stored functions
- Loop
- Exceptions
- Syntax compatibility
- Prepared statements
- Packages
- Reserved words

Traditional MariaDB SQL/PSM syntax **continues to work as before**

# MariaDB Enterprise Platform versus PostgreSQL

## Feature comparison

| MariaDB Enterprise Platform                         | PostgreSQL   |
|---|--|
| Multiple storage options to tailor storage to needs | Single storage engine leads to inefficiency  |
| AI and ML capabilities fully integrated             | Require third-party tools  |
| Based on SQL norms                                  | Code rewriting from PL/SQL to PL/pgSQL required  |
| Inherent scalability                                | Requires third-party product for horizontal scaling for write capabilities; read scaling only via replicas |
| High availability and automatic failover included   | Require third-party tools  |
| SET SQL_MODE = ORACLE                               | Require third-party tools  |
| Enterprise-grade single solution                    | Full capabilities require third-party products   |

# MariaDB vs PostgreSQL: Why MariaDB is the Better Enterprise Solution

| Feature                            | MariaDB   | PostgreSQL   |
|------------------------------------|---|--|
| <b>Clustering</b>                  | ✓ Native <b>multi-master clustering</b> with Galera; automatic node failover and sync   | ✗ No native multi-master; sharding and clustering depend on external extensions  |
| <b>Replication</b>                 | ✓ <b>Galera synchronous replication</b> + async replication; supports <b>multi-source replication</b>                           | ⚠ Synchronous and logical replication are available but less mature; single-writer architecture limits write scalability |
| <b>Scalability (Horizontal)</b>    | ✓ Scales writes and reads natively using Galera; also supports native <b>sharding</b>   | ✗ Horizontal scaling for writes requires Citus (not core); read scaling via replicas only                                |
| <b>High Availability (HA)</b>      | ✓ <b>Built-in</b> with <b>Galera Cluster</b> ; no third-party tools needed; native synchronous multi-master HA                  | ✗ Requires third-party tools like <b>Patroni</b> , <b>repmgr</b> , or Citus for HA or clustering                         |
| <b>Failover &amp; Recovery</b>     | ✓ <b>Automatic failover built-in</b> with Galera; no external orchestrators required  | ✗ Needs third-party orchestrators for automatic failover (e.g., Patroni)   |
| <b>Backup &amp; Recovery</b>       | ✓ Hot backups with <b>MariaBackup</b> ; supports full, incremental, and streaming backups natively                              | ✗ Requires tools like <b>pgBackRest</b> or <b>Barman</b> ; more operational complexity                                   |
| <b>Point-in-Time Recovery</b>      | ✓ Full PITR using binary logs   | ✓ Full PITR using WAL files  |
| <b>Simplicity &amp; Operations</b> | ✓ Easier to set up, manage, and operate; lower DBA overhead for HA, backups, replication, clustering                            | ✗ Operational complexity grows quickly for HA, DR, and scaling needs   |
| <b>ACID Compliance</b>             | ✓ Full ACID via InnoDB or MyRocks   | ✓ Full ACID compliance   |
| <b>Query Optimizer</b>             | ✓ <b>Superior cost-based optimiser</b> , better join handling, distributed query optimisation, traceable plans, optimiser hints | ✗ Limited hinting, occasional plan instability, less efficient with distributed or complex joins                         |
| <b>Concurrency Model</b>           | ✓ MVCC with InnoDB; Galera handles conflict detection with cert-based replication   | ⚠ MVCC, but requires <u>handling deadlocks</u> at higher concurrency levels.   |

# MariaDB vs PostgreSQL: Why MariaDB is the Better Enterprise Solution

| Feature               | MariaDB  | PostgreSQL  |
|-----------------------|--|---|
| Storage Engines       | ✓ Pluggable: <b>InnoDB, MyRocks, Aria, ColumnStore, Spider (sharding)</b> , flexible for <b>OLTP, OLAP</b> , or hybrid | ✗ Single engine; no pluggable storage engines   |
| OLAP + OLTP           | ✓ Native <b>ColumnStore</b> for analytics on the same database; no external data warehouse needed                      | ✗ Limited OLAP; relies on external tools or extensions like Timescale or Citus                                  |
| JSON                  | ✓ JSON functions for typical use; excels in relational workloads   | ✓ JSON support with binary storage (JSONB)  |
| GIS/Spatial Support   | ✓ Fully OGC-compliant GIS capabilities; works well for most location-based workloads                                   | ⚠ Requires the use of <b>PostGIS</b> .  |
| Security Features     | ✓ Role-based access, encryption at rest, masking, key management   | ✓ Similar, but with some advanced row-level security capabilities   |
| Cloud-Native          | ✓ Available on all major clouds  | ✓ Available on all major clouds   |
| License Model         | ✓ GPL v2 (copyleft); encourages community contributions while offering a commercial enterprise version                 | ✗ PostgreSQL License (permissive BSD-like); allows companies to use without contributing back                   |
| Vendor Lock-in        | ✓ GPL ensures the core remains open-source; MariaDB Corporation offers enterprise features without locking data        | ✗ PostgreSQL is permissively licensed; some managed services create partial lock-in with proprietary extensions |
| Enterprise Support    | ✓ Direct from <b>MariaDB Corporation</b> with enterprise features, SLAs  | ⚠ Via <b>EDB, Crunchy Data</b> , or others, community-driven but fragmented                                     |
| Community & Longevity | ✓ Backed by MariaDB Foundation + corporate; forked from MySQL to protect open-source integrity                         | ✓ Mature and stable community; independent foundation-led   |

# Components of MariaDB Enterprise Platform 2025

# MariaDB Enterprise Server

A hardened, production-grade database that delivers enhanced reliability and stability

Ensure predictable operations and minimize risk with up to 8-year long-term support commitment

Ongoing backports of key features deliver the latest innovations, giving you access to advanced features without the disruption of mandatory upgrades

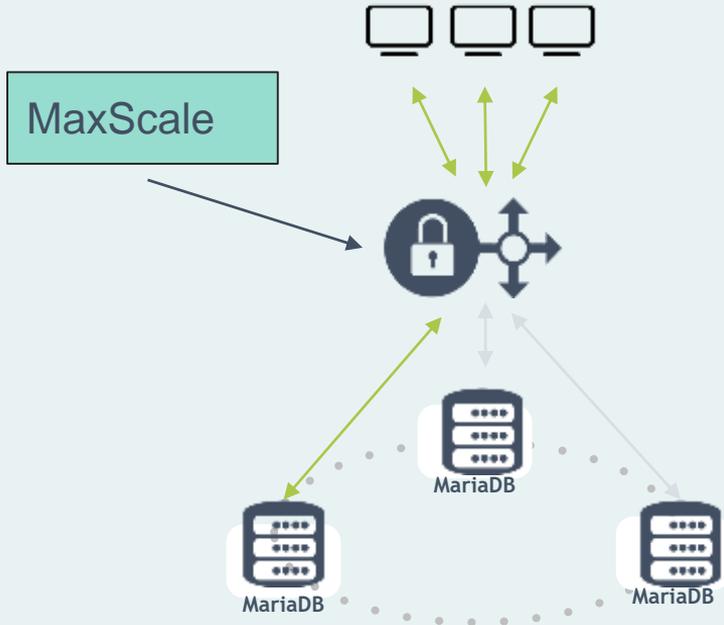

Deployment flexibility is offered across public, private and hybrid cloud environments

Support for diverse workloads including transactional processing, analytical queries and mixed workloads, accommodating relational, JSON and vector data models

# MariaDB MaxScale

A robust and advanced intelligent database proxy

Designed for production environments, MariaDB MaxScale delivers enterprise-grade high availability, scalability, security and integration services, seamlessly complementing MariaDB Enterprise Server

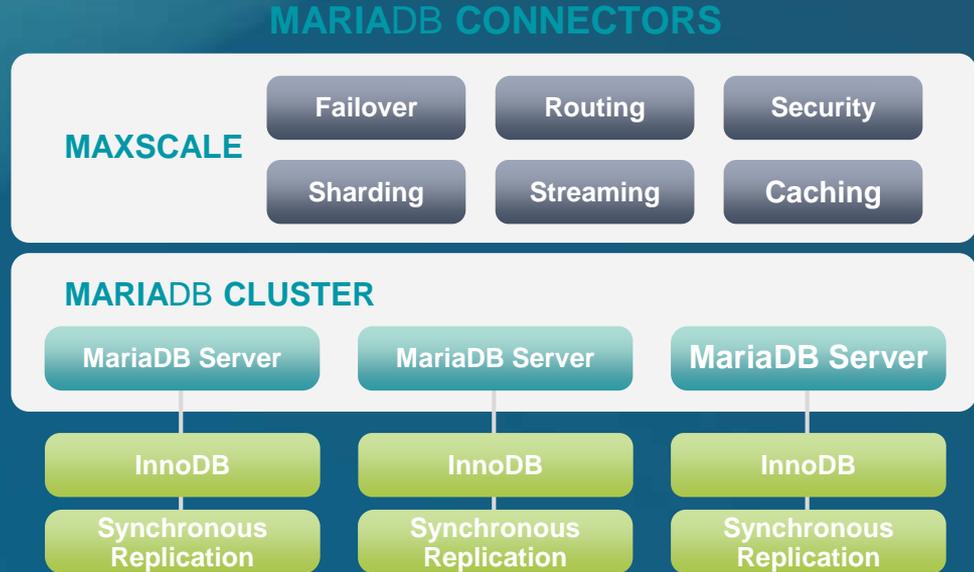

- Enables HA, scalability, security, and integration services
- Intelligent, low-latency load balancer designed for MariaDB Server
- Insulates client applications from database architecture
- Routes application requests based off specific algorithms, database component states, and session state

# MariaDB Enterprise Cluster, Powered by Galera

An active-active, multi-master synchronous replication solution

MariaDB Enterprise Cluster, an open source active-active, multimaster synchronous replication solution provides parallel replication and data consistency across nodes

- High Availability for InnoDB
- All nodes are equal, read and write to any node
- Asynchronous Replication between Clusters supported
- Typically, an odd number of nodes to avoid split brain
- Automatically manages the identification and removal of failed nodes as well as rejoining new or repaired nodes

# SCALING

## Load balancing across database clusters

- MariaDB Primary/Replica
  - Semisynchronous Replication
  - Asynchronous Replication

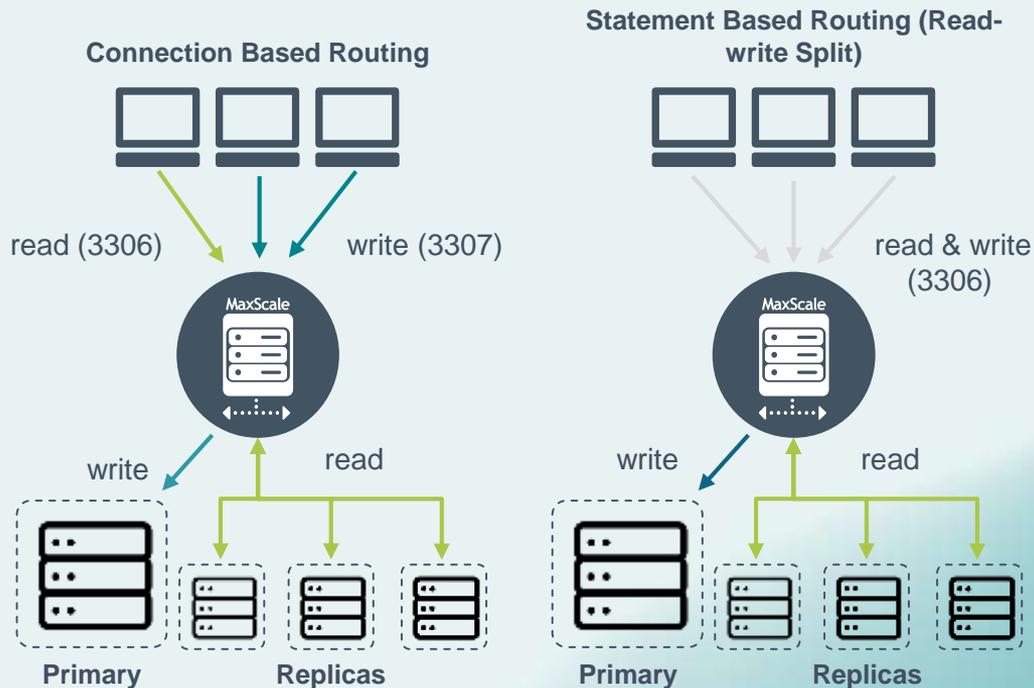

## Routing based on

- Query Types
- Query Patterns
- Database Server State
- Replication Lags

## Scale database environment without application impact

Minimize maintenance downtime

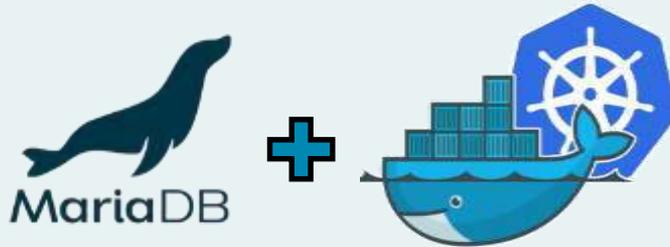

Automatic Failover and Replay

# MariaDB Kubernetes Operator

Deploy complex, production-ready MariaDB topologies using a simple declarative file

Enterprise-grade security, OpenShift compatibility and flexibility for regulated industries, backed by commercial support

- Red Hat OpenShift Certified Operator, providing seamless deployment with Red Hat UBI-based minimal, secure docker images
- Advanced TLS delivers customizable ciphers (RSA), flexible certificate lifetimes, and rotation – critical for regulated environments
- Immutable Images enable enhanced security and consistency
- MaxScale Enterprise and Galera support for replication
- HELM installation
- Google Distributed Cloud (Air-Gapped) support

# MariaDB Vector Search

Build sophisticated RAG systems, semantic search, and other AI-powered applications

## Simplified Data Stack

Manage relational data and vector embeddings in one unified environment

Reduce complexity, overhead, and data synchronization headaches

## High Performance

Fast, high-QPS similarity searches for AI applications

Ensure optimal performance and seamless integration without requiring specialized external databases

## Cost-Effective Vector Search

Leverage existing infrastructure for integrated vector search

Simplify administration and reduce operational overhead

## Seamless Integration

Query for visually similar products that match structured criteria within a single SQL statement

# Migration Success Stories

# Migration Framework

## Exploration

- Evaluate Scope and Feasibility
- Define Value Proposition
- Select Approach
- Proof of concept success criteria

## Architecting

- Define System design
- Identify Integration Requirements
- Develop strategy and Operating practices

## Migrating

- Deploy Architectures
- Convert Schema's
- Migrate Data
- Develop Automation runbooks
- Quality testing and Assurance process

## Integrating

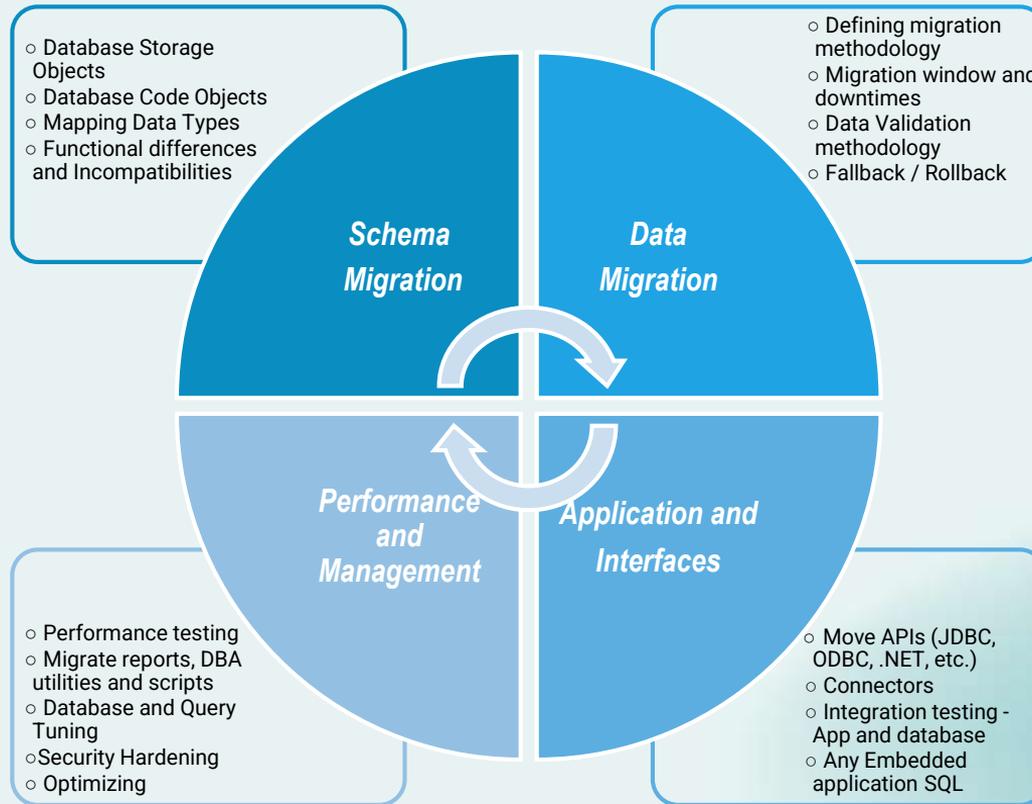

- Application Integration
- Optimization and Calibrate Performance
- Enhance Security Posture
- Production Readiness Preparation

## Operating

- Deployment to production
- Smooth Handoff to operations
- Operations and Optimizations Strategy

# Migration Considerations

# SQLines and Migration Portal

**SQLines Data**

Overview  
Command Line  
Configuration File  
Connection Strings  
Data Validation

Migration to MariaDB

**SQLines Report Summary**

Conversion Complexity Score: 1.1 (Very Low Complexity)

The total number of lines does not include empty lines and comments:

| Lines                | Count       |
|----------------------|-------------|
| Total Non-Empty      | 2,527       |
| Need Conversion      | 1,727 68.3% |
| No Conversion Needed | 800 31.7%   |

Conversion:

## SQLines SQL Converter

- Converts **database schema (DDL)**, queries (DML/SELECT), views, stored procedures, functions, and triggers between
- Provides **assessment reports** (HTML/JSON) detailing object counts, data types, functions,
- Supports **extensive customization**: schema/object/identifier mapping, data-type remapping, metadata injection.

## SQLines Data (SQLData)

- Automates **bulk data migration** and **data transfer**
- Features **high-performance** multi threaded ETL on Linux/Windows
- Offers fine-grained control: column selection, transformations, filtering, chunked loads, parallel sessions .
- Supports **migration validation** by row-count and value-level comparison

## Assessment Portal

- **Upload Oracle DDL**, SQL queries, stored procedures, functions, and triggers for analysis.
- **Object Breakdown**: Detailed counts of tables, views, procedures, etc.
- **Compatibility Matrix**: Categorizes objects as Directly Compatible, Automatically Convertible, or Manual Intervention Required.

## Benefits

- **Enterprise-Scale Readiness**: Designed for **fully automated, customizable pipelines**
- **High-Quality Code Conversion**: Ensures output that **preserves formatting** and maintainability
- **Flexible Deployment Options**: A versatile mix of online, desktop, and command-line workflows.
- **Comprehensive Support**: Built-in assessment, reporting, technical support for complex projects.
